

TO WHOM IT MAY CONCERN

A prototype "Anti Bio" system was installed on our 25m pool on 24 January 1998. I was understandably sceptical, but willing to give the system a chance to prove itself. One week after the system was turned on we did a backwash. The waste water was extremely dirty and so were the next two. After this we noticed that the backwash requirement was reduced by 25-30%. This is a major saving in water and we can only put this down to "Anti Bio".

Being installed before the filter, it seems to have loosened or cleaned out grime from the filter medium. This, in turn, has given us a clarity of water not seen before in this pool, plus a more stable balance.

Chlorine consumption has been reduced by approximately 40%. In fact, over the closed season, we ran the pool with little or no chlorine and the water clarity stayed excellent at all times. On the start of the next season, it was a simple exercise of getting the chlorine levels up to recommended guidelines. This was done in record time with a lot less chemicals than normally experienced on start-up.

Our experience has warranted, no doubt, of the benefits of "Anti Bio". Teachers and bathers alike, have commented on the clarity and condition of the pool. It seems no more sore eyes and skin problems.

As the technology has developed so that no intrusion is necessary to pipework, we have instigated installation on our 50m Olympic pool.

I can highly recommend "Anti Bio" to any pool operator wishing to reduce chemical use, maintenance, waste water and have a healthier environment for bathers.

Yours faithfully

MARK YOUNG
